SUBMISSION OF EXECUTED DECLARATION UNDER 37 C.F.R. §1.132

Commissioner for Patents
Washington, D.C. 20231

Sir:

Submitted herewith is an executed Declaration Under 37 C.F.R. §1.132 signed by Toshi Tsuzuki. An unexecuted version of this Declaration was filed with the Amendment filed on November 30, 2001.

Respectfully submitted,

Jennifer M. Hayes

DECLARATION UNDER 37 C.F.R. § 1.132

Commissioner for Patents
Washington, D.C. 20231

Sir:

I, Toshi Tsuzuki, hereby declare and state:

THAT I am a citizen of Japan;

THAT I have received the degree of Bachelor of Science in Chemistry in 1982 from
Tokyo Institute of Technology in Tokyo, Japan;

THAT I have been employed by Showa Denko K.K. since 1996, where I hold a position
as Senior Researcher in the Central Research Laboratory. Prior to my employment with Showa
Denko, K.K., I served as a research fellow at the Rosenstiel School of Marine and Atmospheric
Science at the University of Miami in Miami, Florida from 1994-1996; Researcher with Showa
Denko, K.K. from 1990 -1994 in the Central Research Laboratory, and as a researcher with Life
Science Research Laboratory of Showa Denko K.K.;

THAT I work mainly in the fields of Biochemistry, Microbiology and Bioengineering and I specialize in the field of biochemistry of ascorbic acid derivatives, tocopherol and its derivatives and steroids.

THAT I am a co-inventor of the above-identified patent application;

I submit this Declaration in support of the patentability of our invention;

The following experiments to compare the inhibitory effect of ascorbic acid-2-phosphate zinc salt as claimed when compared to other ascorbic acid phosphate salts were conducted by me or under my direction and control.

EXPERIMENTATION

Experiment 1

A test using a three-dimensional reconstruction culture skin cell model was performed as follows to compare the skin primary irritation of zinc ascorbate (ASZ), a mixture of sodium ascorbate and zinc salt (APNa + Z), zinc ascorbic acid-2-phosphate (APZ), and a mixture of sodium ascorbic acid-2-phosphate and zinc salt (APNa + Z).

Each test substance was added to and dissolved in a 20 mM phosphate buffer (pH: 7.0) containing 150 mM sodium chloride, to a concentration shown in Table 1 below and the obtained solutions were used as test stock solutions. Each of these stock solutions was diluted stepwise with a common ratio of 3.16 to prepare test solutions having a concentration after the 1,000-fold or less dilution of the test stock solution. The ascorbic acid moiety and zinc contained in these test solutions had the same molar concentrations.

BEST AVAILABLE COPY

(Table 1) Test Solutions

Test Substance	Test Stock Solution, Concentration Added (w/wt)						
	AS	ASZ	AP	APZ	AS+Z	AP+Z	Z
Sodium ascorbate	17	-	-	-	17	-	-
Zinc ascorbate	-	21	-	-	-	-	-
Sodium ascorbic acid-2-phosphate	-	-	28	-	-	28	-
Zinc ascorbic acid-2-phosphate	-	-	-	30	-	-	-
Zinc chloride	-	-	-	-	17	17	17

The test solution and the above-described buffer solution each in 0.1 ml were superposed one on another on a three-dimensional culture skin model (produced by Gunze Ltd., diameter: 9 mm) and the skin model was cultured in a carbon dioxide gas incubator at 37°C for 24 hours. After the culturing, the test solution was removed and the skin model was washed with a phosphate buffer. This washed skin model was then cultured on a culture solution in a carbon dioxide gas incubator at 37°C for 16 hours. Thereafter, the skin model was transferred to a culture solution containing 0.5 mg/ml of MTT (3-(4,5-dimethyl-2-thiazolyl)-2,5-diphenyl-2H-tetrazolium bromide) and further cultured in a carbon dioxide gas incubator at 37°C for 3 hours. The precipitated formazan was extracted with isopropanol containing 0.04N hydrochloric acid and subjected to colorimetry using a wavelength of 570 nm.

From the measured values, the survival rate of the cultured cells when each solution was added was calculated and plotted with respect to the concentration. By fitting this to sigmoid curve, the concentration of each test solution for 50% survival was determined. The results are shown in Table 2 below.

BEST AVAILABLE COPY

(Table 2) Concentration for 50% Survival

Test Solution	Concentration for 50% Survival (dilution Magnification from test stock solution)
As	4.5
AsZ	313.2
APNa	3.3
APZ	54.5
As+Z	348.5
APNa + Z	49.9
Z	298.3

skin irritate

As apparent from the results in this test, zinc ascorbic acid-2-phosphate (APZ) and a mixture of sodium ascorbic acid-2-phosphate and zinc salt (APNa+Z) have slight skin irritation as compared with zinc salt alone (Z), zinc-ascorbate (AsZ) and a mixture of sodium ascorbate and zinc salt (As+Z).

(Experiment 2)

Under the same test conditions as in Example 4 of the present application, sodium ascorbic acid-2-phosphate (APNa), potassium ascorbic acid-2-phosphate (APK) and aluminum ascorbic acid-2-phosphate (APAl) were examined on the antibacterial activity against Propionibacterium acnes JCM6425.

As a result, the minimum inhibitory concentration (MIC) against this strain was 10 mg/ml or more in all of these compounds.

By this experiment, the antibacterial activity of zinc ascorbic acid-2-phosphate (APZ) against Propionibacterium was verified to be greatly high as compared with other ascorbic acid-2-phosphate salts.

Declaration under 37 C.F.R. § 1.132
U.S. Appl. No. 09/492,763

(Experiment 3)

Under the same test conditions as in Example 5 of the present application, sodium ascorbic acid-2-phosphate (APNa), potassium ascorbic acid-2-phosphate (APK) and aluminum ascorbic acid-2-phosphate (APAl) were examined on the antibacterial activity against *Staphylococcus aureus* 1F012732.

As a result, the minimum inhibitory concentration (MIC) against this strain was 10 mg/ml or more in all of these compounds.

By this experiment, the antibacterial activity of zinc ascorbic acid-2-phosphate (APZ) against *Staphylococcus* was verified to be greatly high as compared with other ascorbic acid-2-phosphate salts.

(Experiment 4)

Under the same test conditions as in Example 6 of the present application, sodium ascorbic acid-2-phosphate (APNa), potassium ascorbic acid-2-phosphate (APK) and aluminum ascorbic acid-2-phosphate (APAl) each in the form of a 10 mg/ml solution were examined on the inhibitory activity against lipase derived from *Pseudomonas*.

As a result, inhibitory activity against this enzyme was not recognized in these compounds.

By this experiment, the inhibitory activity of zinc ascorbic acid-2-phosphate (APZ) against lipase derived from *Pseudomonas* was verified to be greatly high as compared with other ascorbic acid-2-phosphate salts.

U.S. Appl. No. 09/492,763

(Experiment 5)

Under the same test conditions as in Example 7 of the present application, sodium ascorbic acid-2-phosphate (APNa), potassium ascorbic acid-2-phosphate (APK) and aluminum ascorbic acid-2-phosphate (APAl) each in the form of a 10 mg/ml solution were examined on the inhibitory activity against lipase derived from *Propionibacterium*.

As a result, inhibitory activity against this enzyme was not recognized in these compounds.

By this experiment, the inhibitory activity of zinc ascorbic acid-2-phosphate (APZ) against lipase derived from *Propionibacterium* was verified to be greatly high as compared with other ascorbic acid-2-phosphate salts.

(Experiment 6)

Under the same test conditions as in Example 8 of the present application, sodium ascorbic acid-2-phosphate (APNa), potassium ascorbic acid-2-phosphate (APK) and aluminum ascorbic acid-2-phosphate (APAl) each in the form of a 10 mg/ml solution were examined on the inhibitory activity against hyaluronidase derived from *Propionibacterium*.

As a result, inhibitory activity against this enzyme was APNa: 19%, APK: 31%, and APAl: 39%.

By this experiment, the inhibitory activity of zinc ascorbic acid-2-phosphate (APZ) against hyaluronidase derived from *Propionibacterium* was verified to be greatly high as compared with other ascorbic acid-2-phosphate salts.
